

How to Create an Executable (.jar) File in IntelliJ

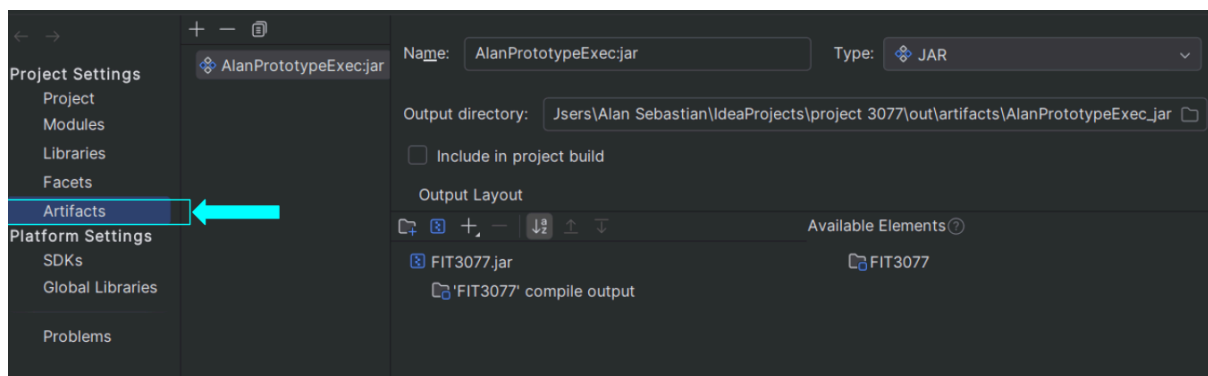

Alan Sebastian 33855137

This document explains how to create a .jar executable file for a Java program using IntelliJ IDEA.

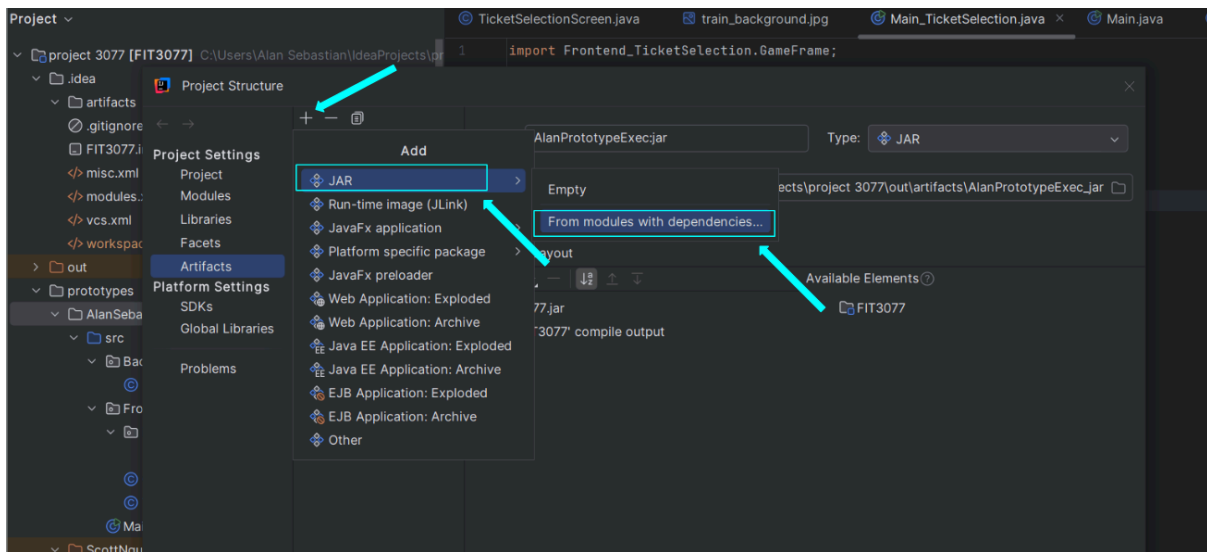

1) Go to File → Project Structure.

2) In the Project Structure window, click on Artifacts.

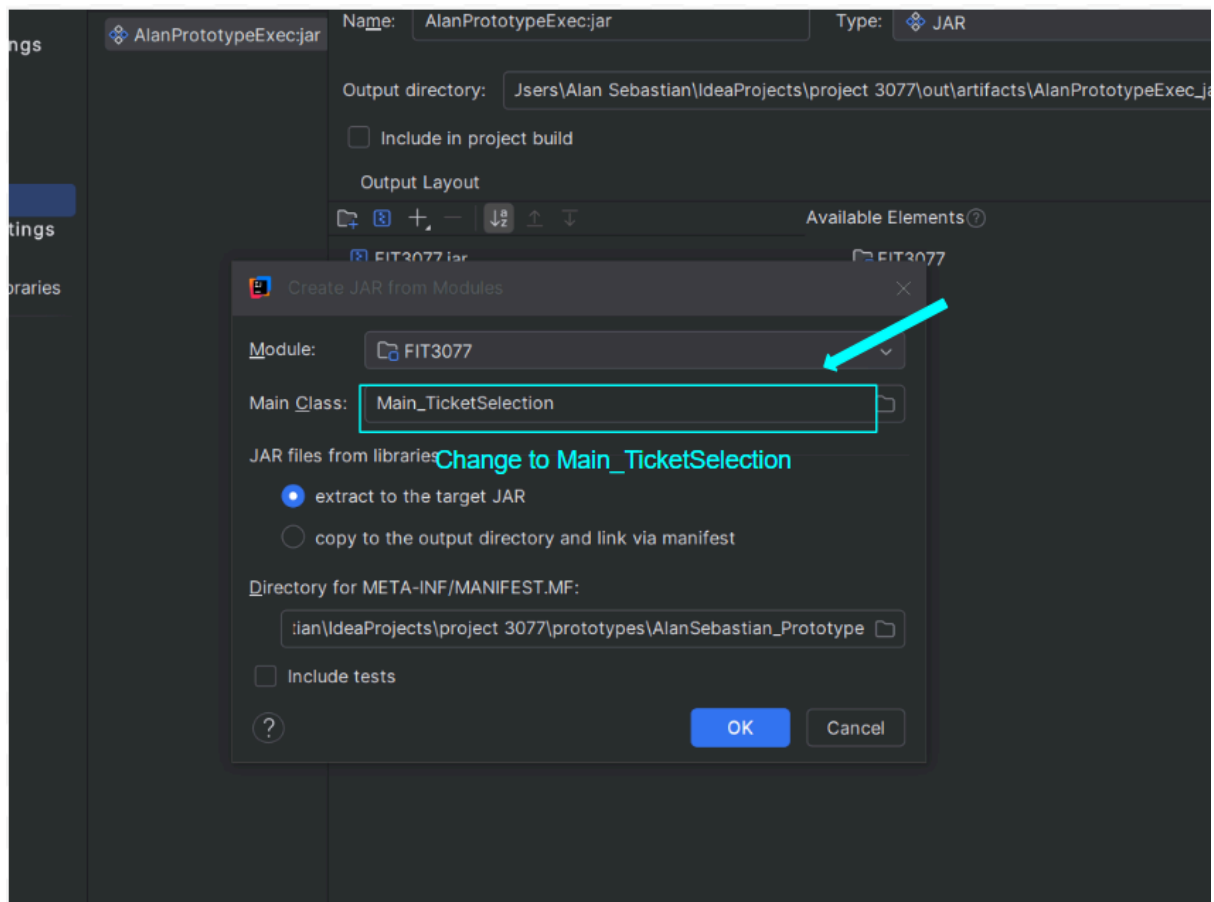

- 3) Click the + (plus) button at the top. Then select JAR → From modules with dependencies

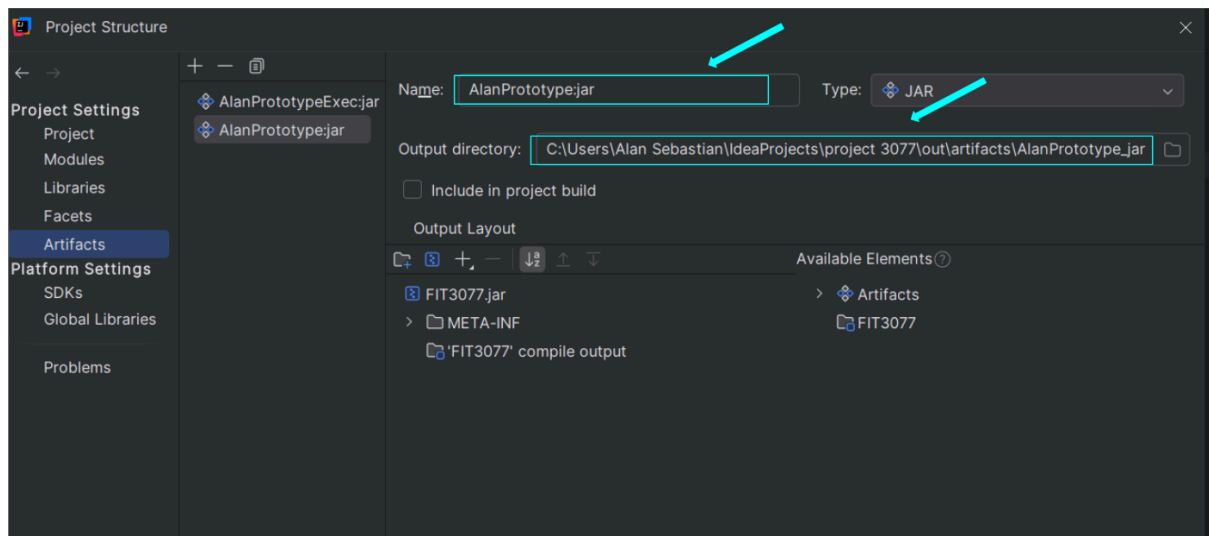

- 4) In the pop-up window:

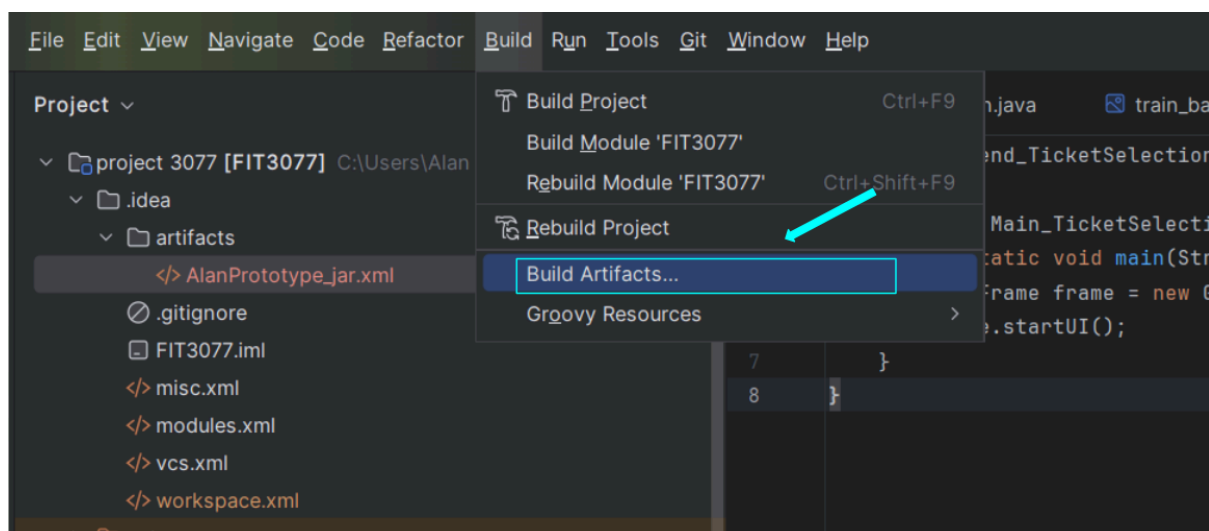

- Choose your main class (e.g. Main_TicketSelection)
- Click OK

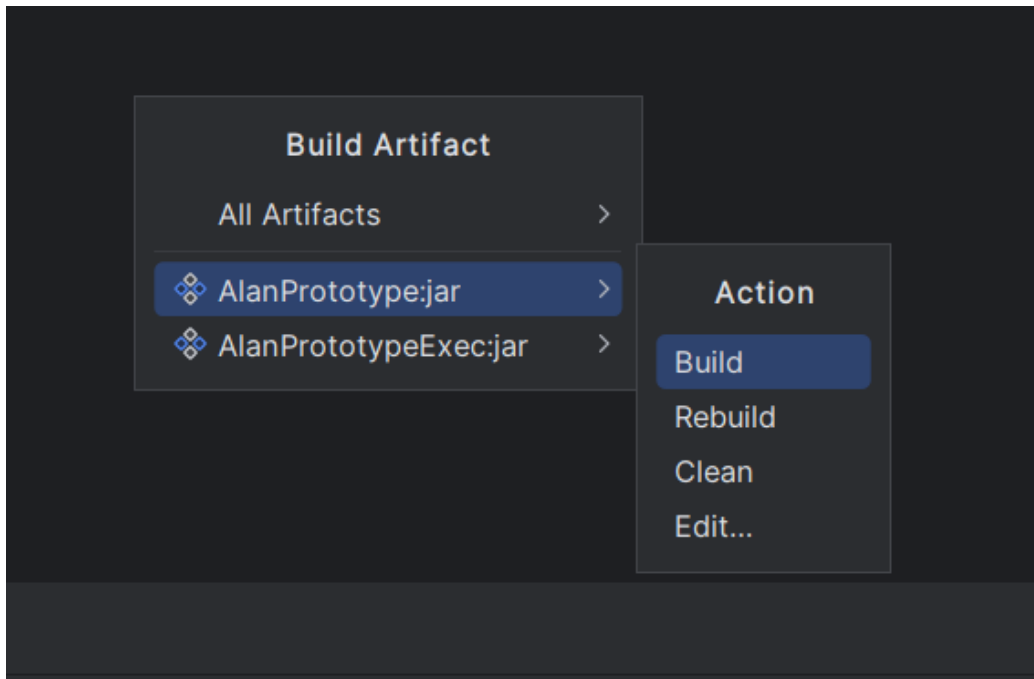

- 5) Rename the .jar file if needed, Choose where it will be saved (output directory) and Click OK

- 6) The artifact for the executable has been created. So now we must build it. Go to Build then Build Artifacts...

- 7) Select your artifact and click Build

8) Your .jar file will now be created in the output directory you selected.
