

How To Create An Executable

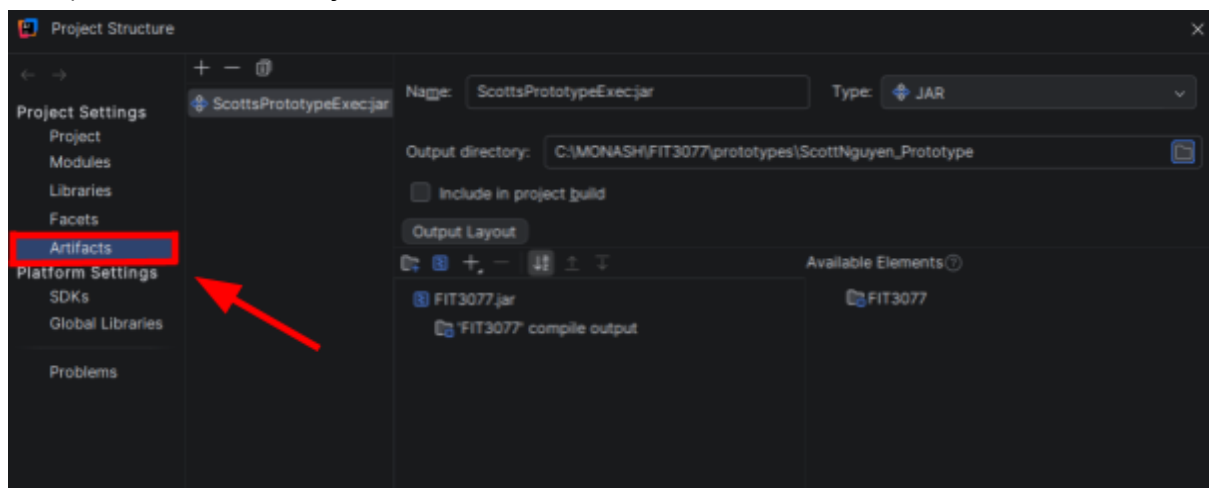

Scott Nguyen 33879095

This document explains how to create a .jar executable file for a Java program in the IntelliJ IDE.

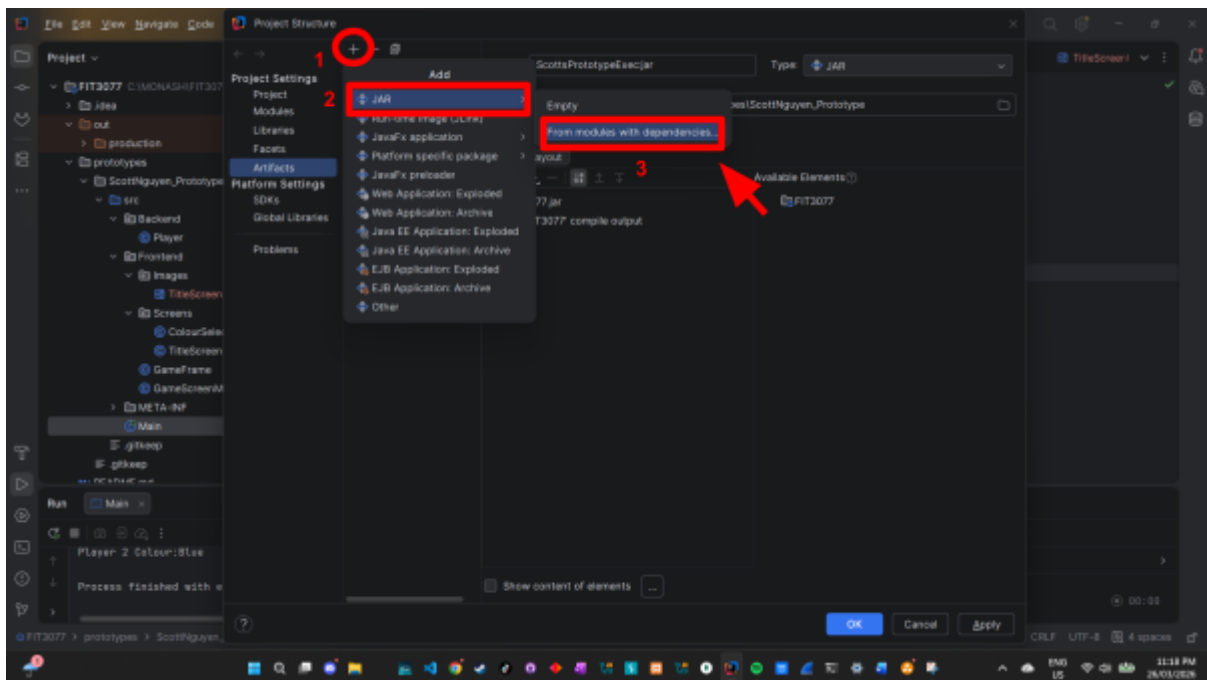

1) Go to File then click Project Structure.

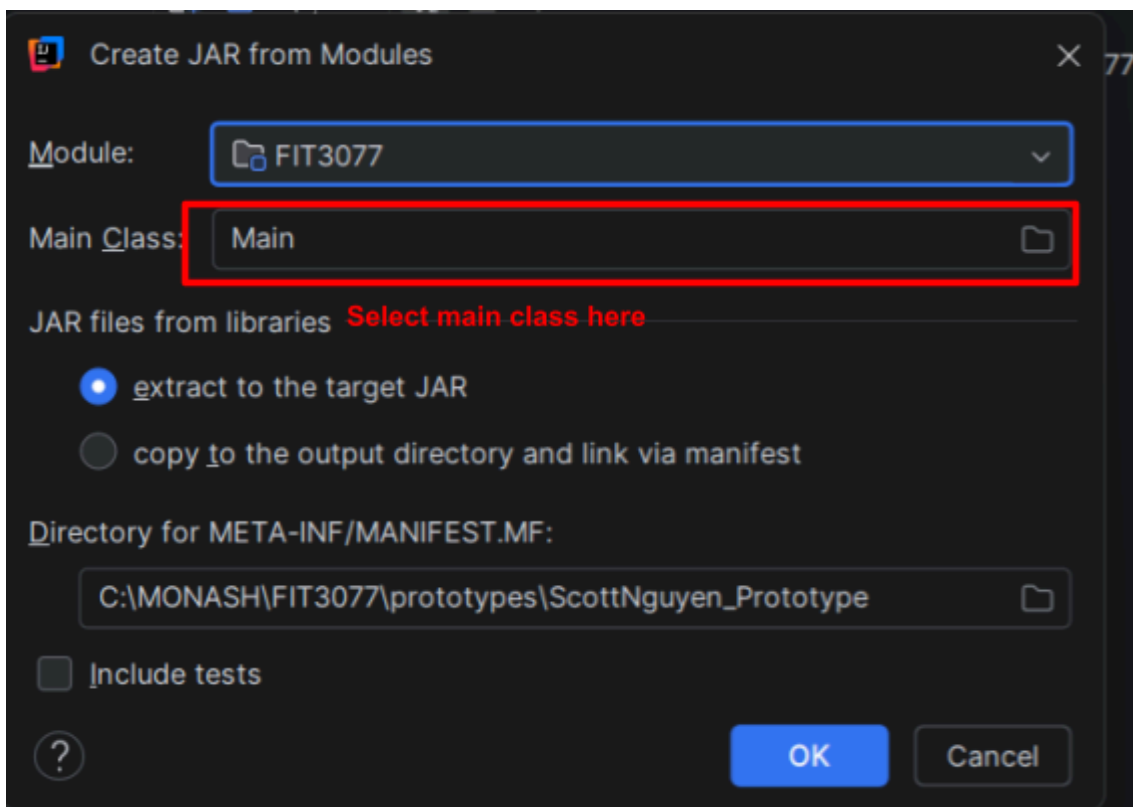

2) Once on the Project Structure screen, click Artifacts.

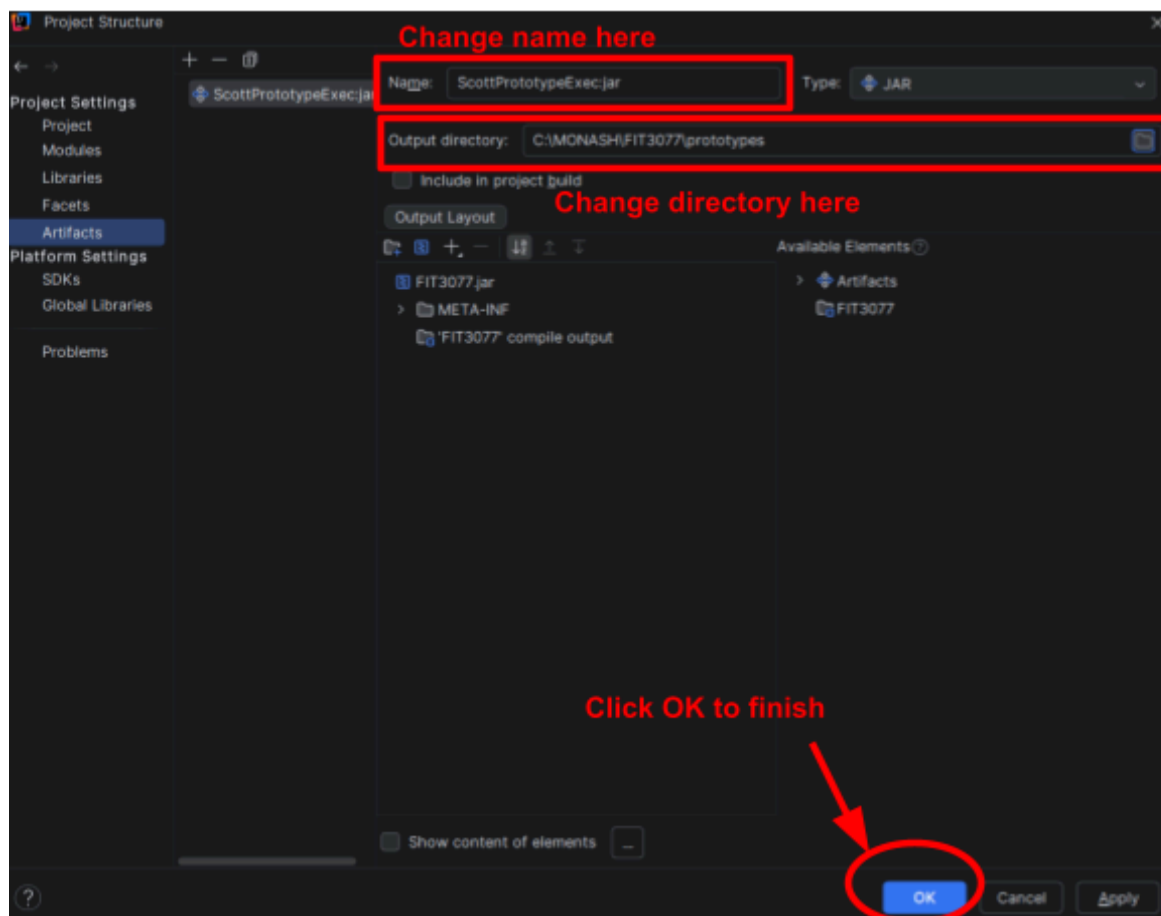

- 3) Then click the plus at the top, then select 'JAR', then 'from modules with dependencies'.

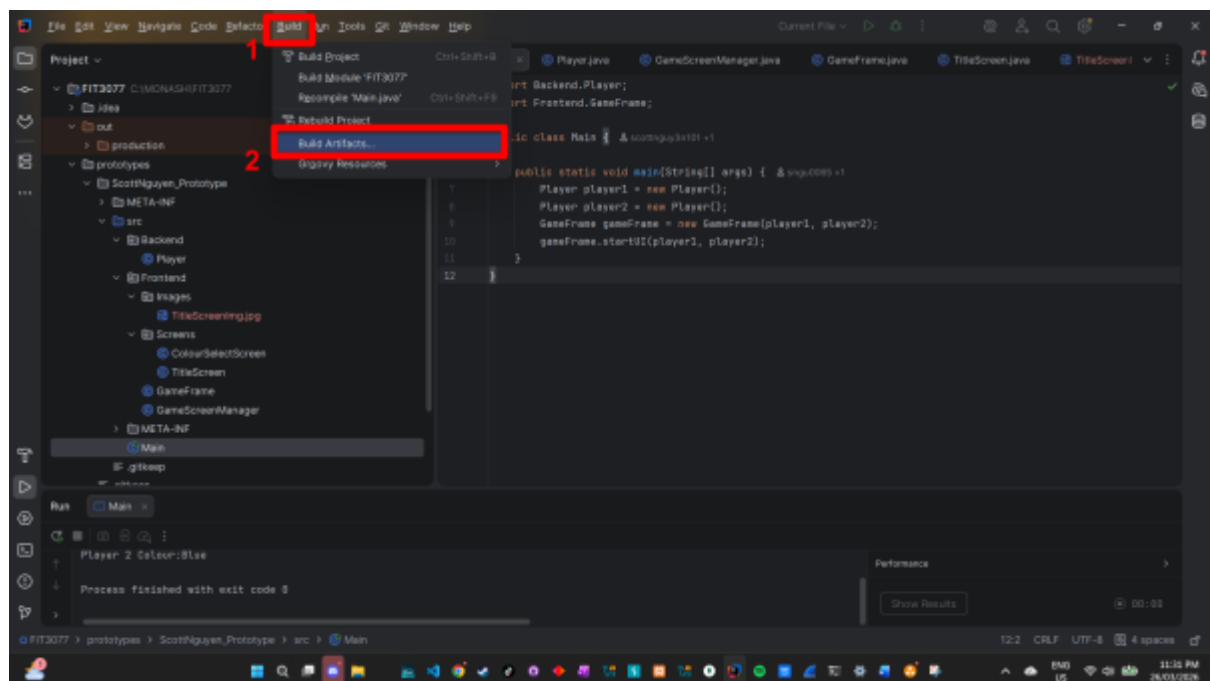

- 4) Then in the pop up, select the main class for the project you want to make an executable, then click OK.

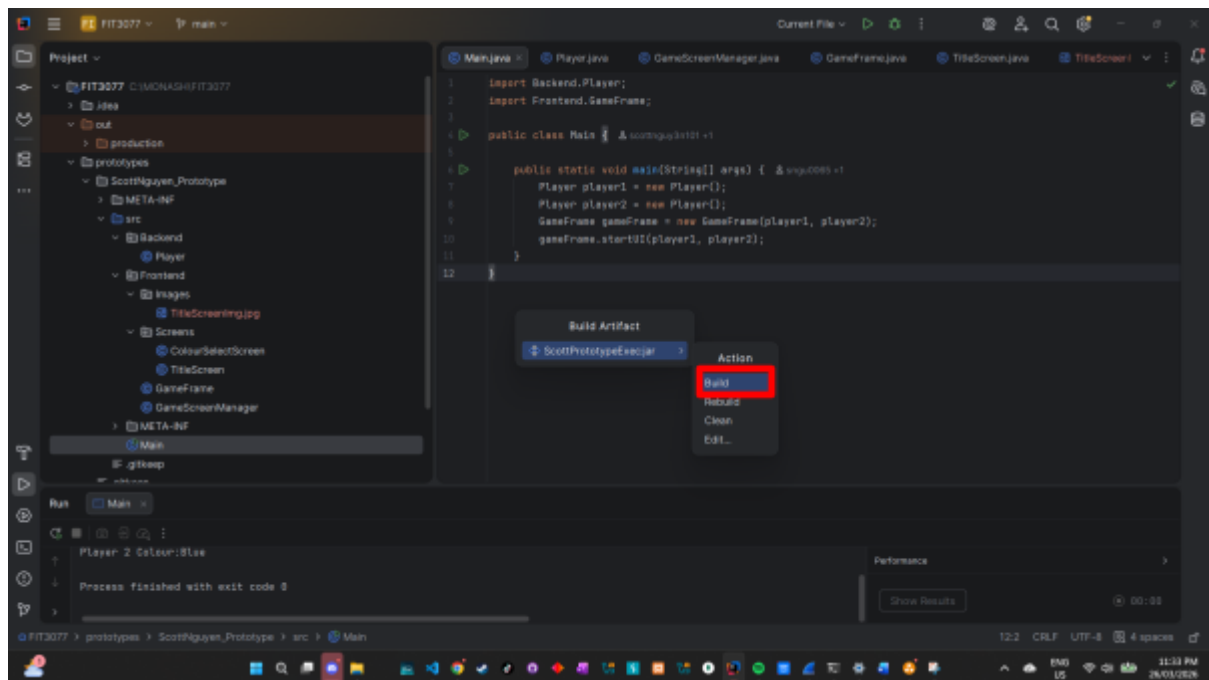

- 5) This takes you back to the Artifacts screen with your new artifact created.
Change the directory and name of the executable as you wish then click OK.

- 6) The artifact for the executable has been created. So now we must build it. Go to Build then Build Artifacts...

7) Then click Build on the artifact you just created.

8) The executable has now been created in the directory you specified earlier.
