

How to Create an Executable (.jar) File in IntelliJ

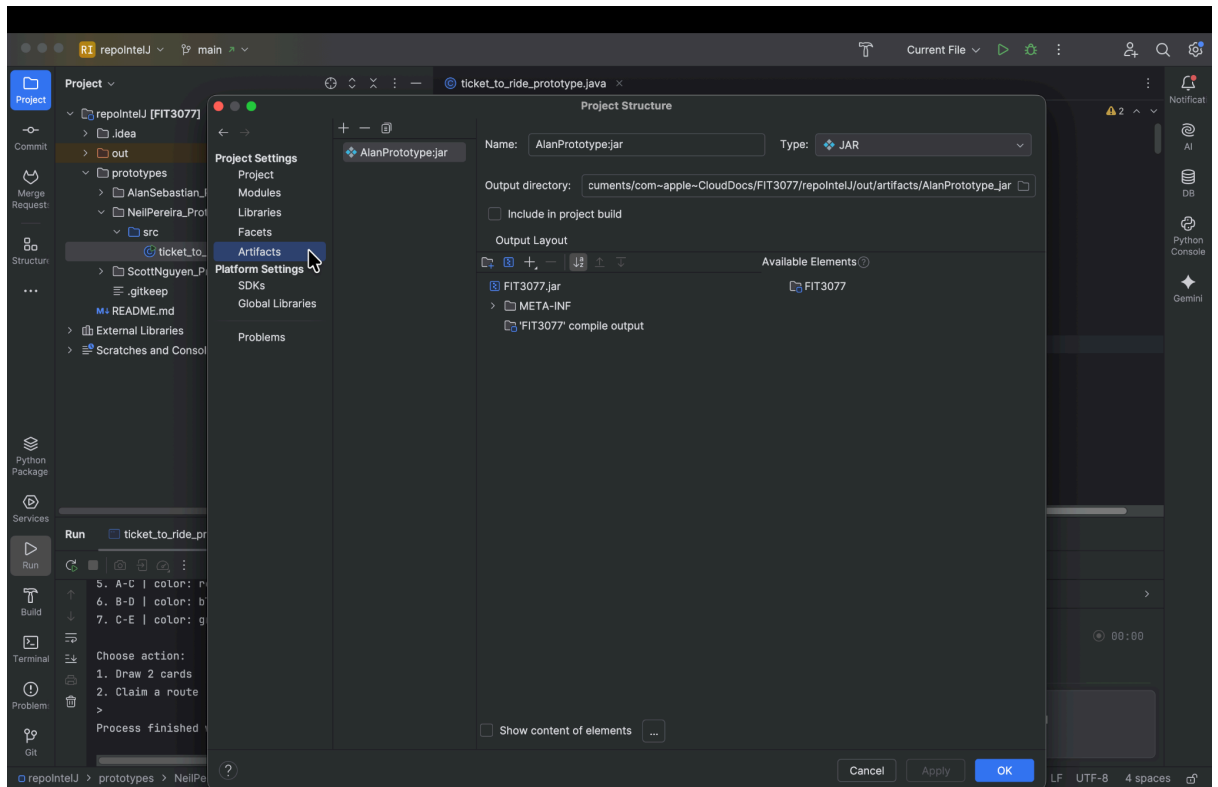

Neil Pereira 35539666

These are the steps to create a .jar executable file using IntelliJ

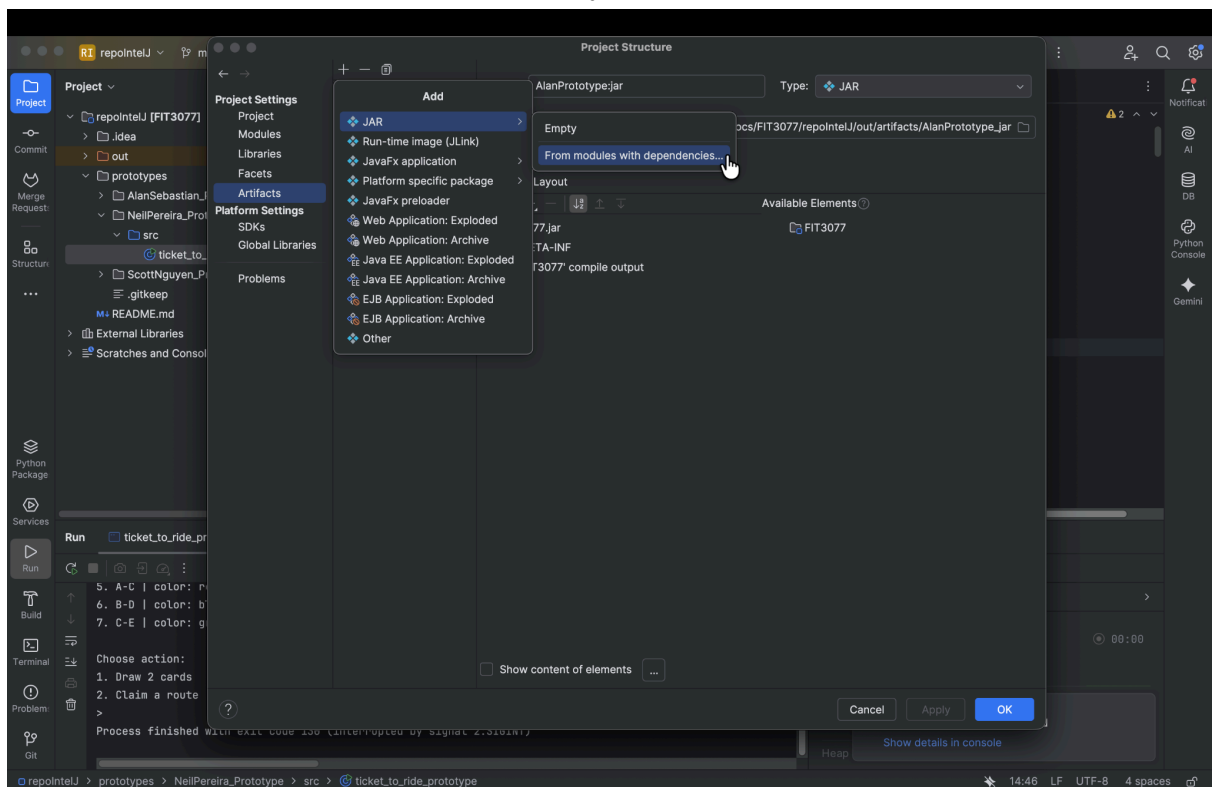

1. Select file and project structure

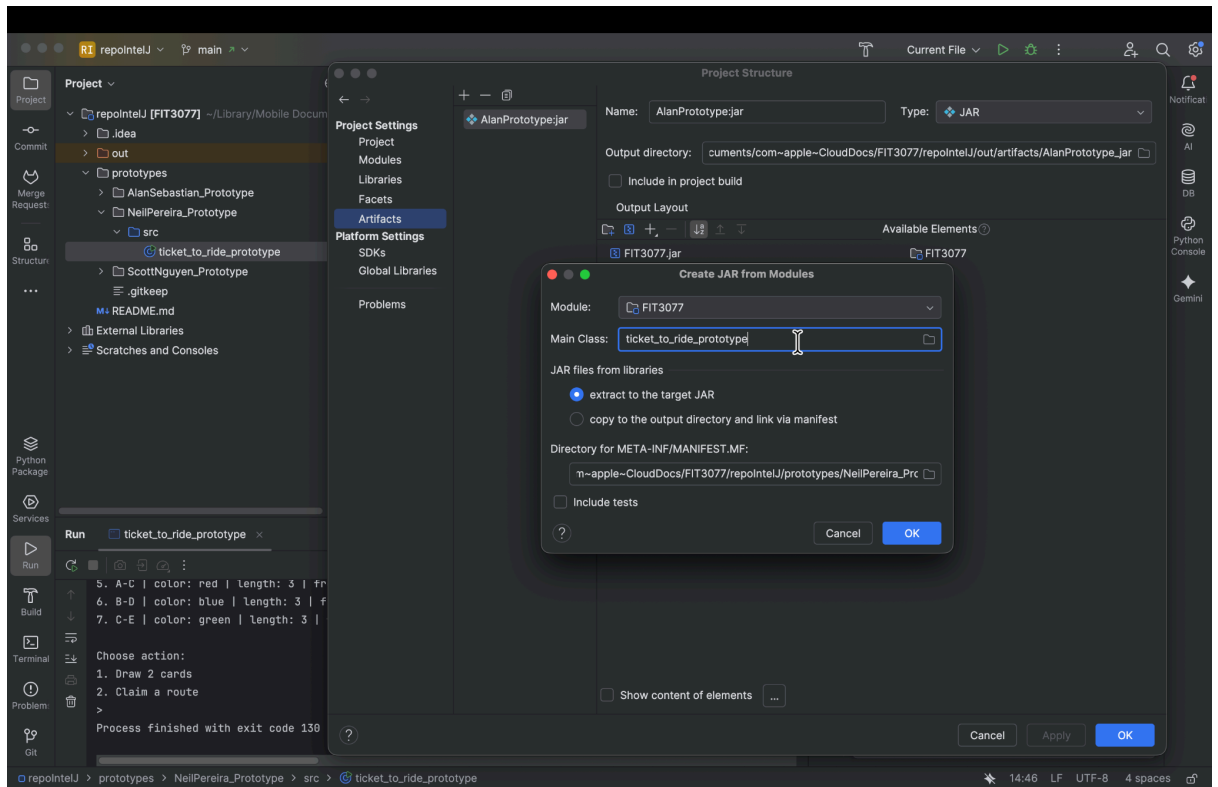

2. Select artifact in the project structure window

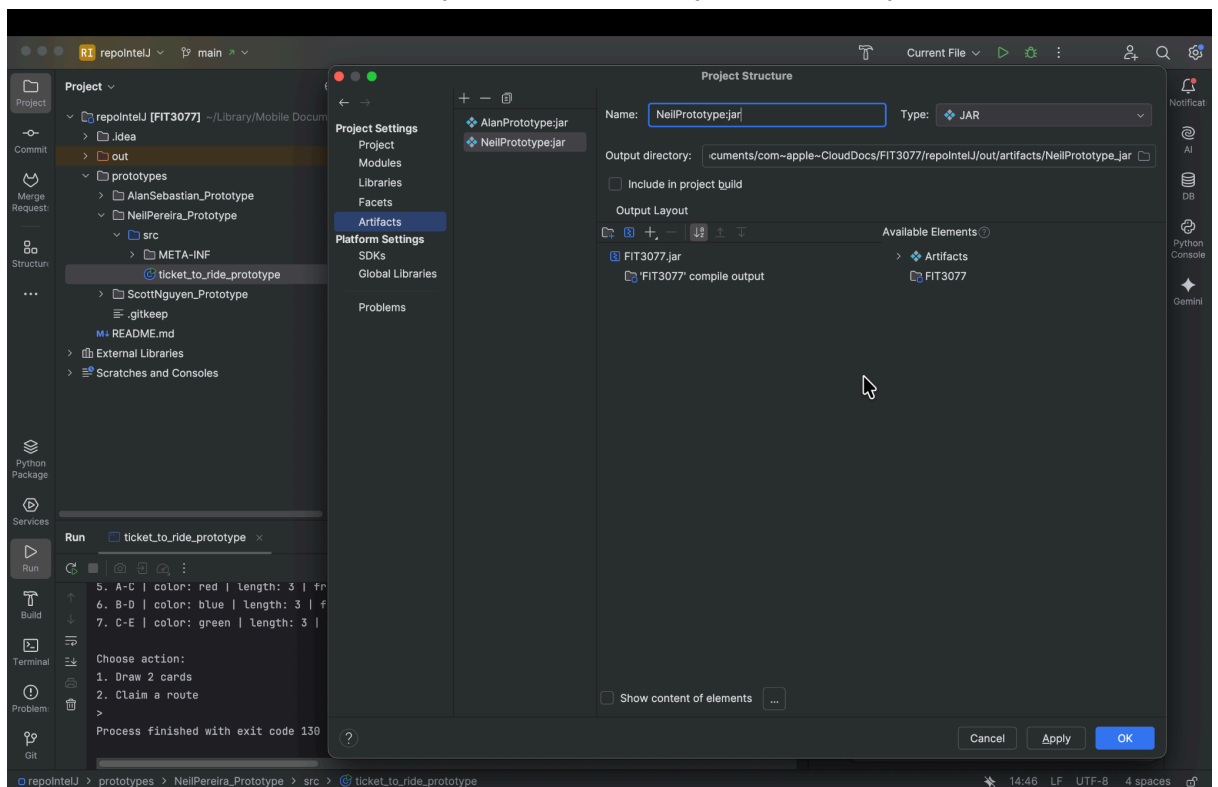

3. Click on the + icon and select JAR followed by From modules with dependencies.

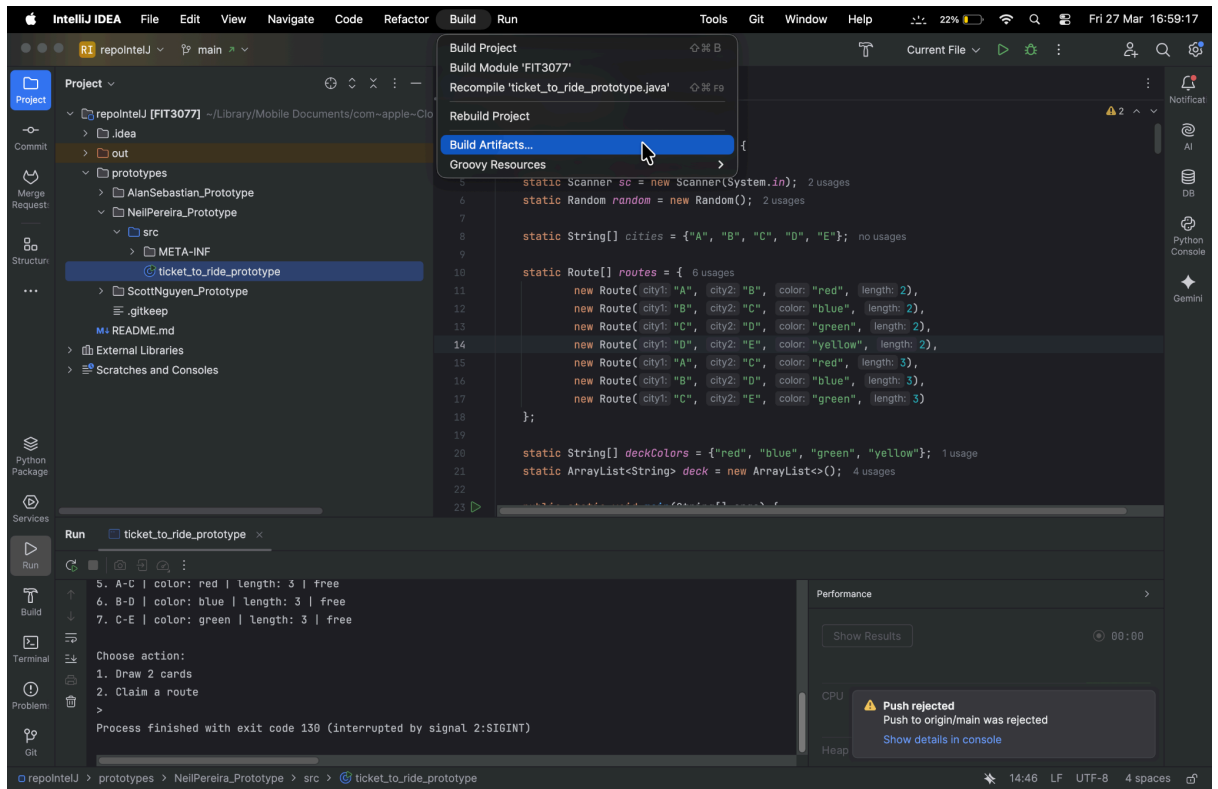

4. Click on the folder icon and select your main class and your directory for the manifest and click okay

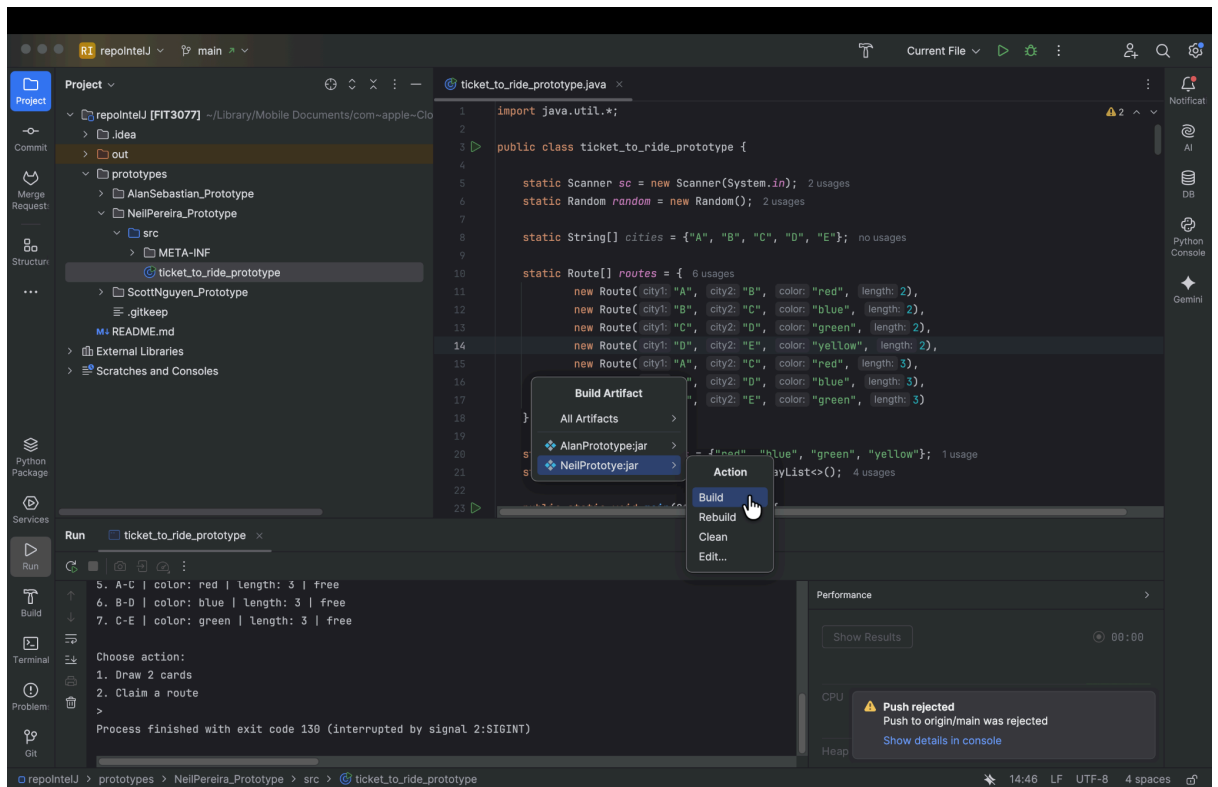

5. Rename the artifact and select your output directory and click okay

6. Select Build and then Build artifacts

7. Select your artifact and select build

Your .jar file should now exist in the directory you selected
